

ACFA Intellect 6.4

Integration modules for Access Control, Fire Alarm and Perimeter Security systems

24 November 2017. Release notes

For information about the system and supported equipment, please see the [product page](#).

New features and improvements

Software modules

- **Access Manager.** Enhancements allow you to: group access levels by folder, print multiple passes at once, copy access levels, search for multiple access points and access levels (when editing these elements), and search for zones and areas. Fixed some minor bugs.
- **Event Manager.** Now an operator can enter a comment when confirming or prohibiting access. Comments are shown in the Report on events in the Intellect Web Report System. Fixed some minor bugs.

Access Control and Fire Alarm systems

- **ApolloSDK v.2.** Support for Apollo internal variables. You can use internal variables to configure complex internal interactions and responses of the Apollo hardware. This feature is similar to macros in Intellect, but since it is hardware-based, the configured functions will work even when the equipment is offline. Fixed some minor bugs.

Fixes

Minor bugs fixed in: modules for the ACS Castle (Sigur), modules for the combined ACS/FSA Galaxy Dimension v.2, Paradox, Paxton, and the FSA UniPos 7000.

Release features

Version 6.4 of the ACFA integration modules includes all new integrations and enhancements of the previous version.

ACFA 6.4 is compatible with **Intellect 4.10.3**. Read more about version compatibility [here](#).
